What is Developmental Biology This introductory section defines the field outlining its scope and significance It distinguishes developmental biology from related fields like genetics and cell biology highlighting its unique focus on the processes of growth and form generation

Historical Overview A brief historical overview is crucial This section typically covers seminal discoveries and influential figures who shaped the field such as Aristotle His early observations on chick development William Harvey His work on embryology and blood circulation Caspar Friedrich Wolff His contributions to the epigenesis theory challenging preformationism Ernst Haeckel His biogenetic law though now largely superseded

Basic Embryological Terminology Mastering terminology is paramount Chapter 1 usually introduces fundamental terms like Gametes Sperm and egg cells Zygote The fertilized egg Embryo The developing organism from fertilization to birth/hatching 2 Fetus The later stage of development in mammals Cleavage The early rapid cell divisions Gastrulation The formation of germ layers ectoderm mesoderm endoderm Organogenesis The formation of organs and organ systems Morphogenesis The development of shape and form

Model Organisms Specific organisms are extensively used in developmental biology research due to their ease of study and unique features Chapter 1 often introduces common model organisms including *Drosophila melanogaster* fruit fly Excellent for genetic studies *Caenorhabditis elegans* nematode worm Known for its simple completely mapped nervous

system *Xenopus laevis* African clawed frog Easy to manipulate embryos *Mus musculus* mouse Mammalian model genetically similar to humans *Arabidopsis thaliana* thale cress A commonly used plant model
